Corporate Signatures

is a system for automatic generation and distribution of uniform corporate style signatures for HCL Notes/Domino platform.

Principle

The system is based upon templates using data from Domino Directory or other suitable address book.

The templates are freely modifiable within HCL Notes client environment – you can change font, layout of name, surname, phone numbers, postcode, company logo, disclaimer and any other items.

The number of templates is not limited. Following the templates, the system automatically generates signatures and saves them into mail databases according to preferences of each single user. Users can choose from up to five ready-to-use signatures (various language options, different job position, etc.).

There is a button in a mail message displayed automatically for each signature, so a signature may be comfortably inserted by a single mouse-click.

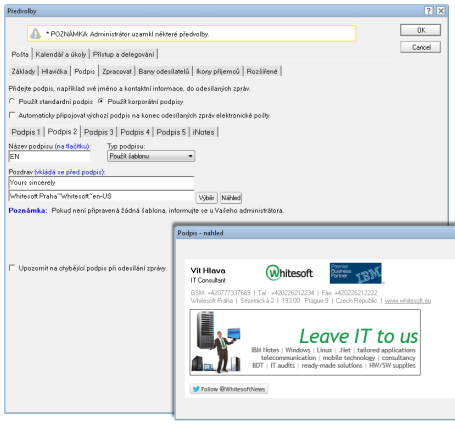
Control

If a template (changed logo, disclaimer etc.) or any data in an address book are modified (phone number, office location, …), the system automatically (i.e. with no need for user's intervention) recreates corresponding signatures and updates users' mail databases.

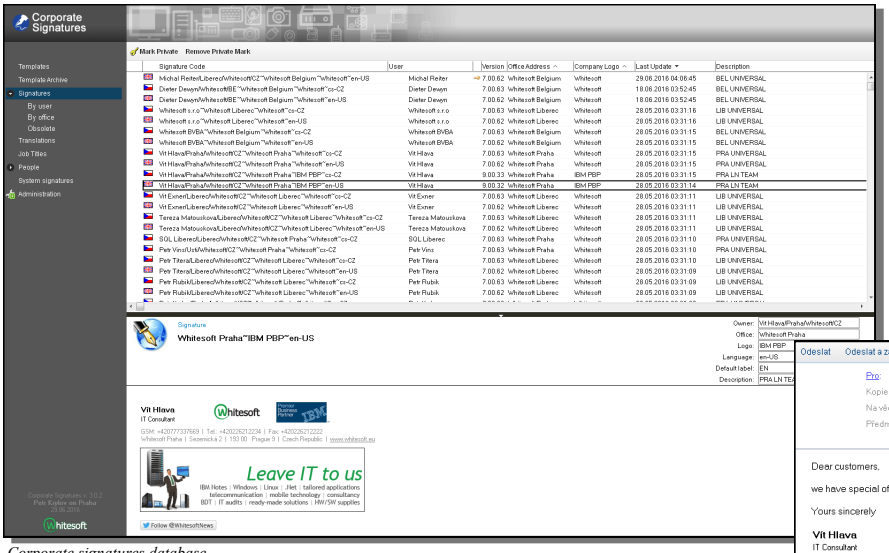
System Requirements

- HCL Notes/Domino
- modification of mail database design

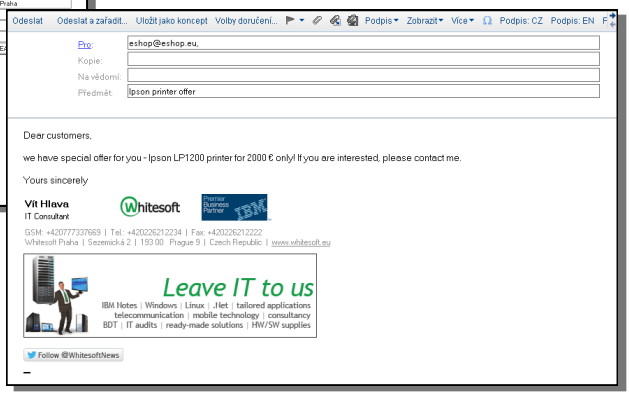
Signature setup within mail client



Signature preview



Corporate signatures database



Message with inserted signature
